TN SKILL PROJECT — IDEATION PHASE

Auto Ticket Classification using Flow Designer

Empathy Map & Persona Analysis for Service Desk Process Automation

1. PROJECT BACKGROUND & OBJECTIVE

In modern enterprise IT Service Management (ITSM), manual handling of inbound user tickets creates operational bottlenecks, delays issue resolution, and risks SLA breaches. This project leverages **Flow Designer** to automatically analyze, classify, and route incoming support tickets to appropriate resolver groups without manual triage.

2. PRIMARY TARGET PERSONA PROFILE

Name: Karthik

Role: Tier-1 IT Support Engineer / Service Desk Specialist

Work Context: Handles over 100 incoming tickets daily. Spends significant shift hours manually reading ticket descriptions, assigning categories, and identifying correct routing groups.

3. EMPATHY MAP: QUADRANT ANALYSIS

SAYS

- "Manually reading and tagging hundreds of tickets every day consumes most of my working hours."
- "Users expect immediate resolution for urgent issues."
- "Incorrectly categorized tickets delay the entire IT response pipeline."

THINKS

- "Is there no way to automate this highly repetitive routing process?"
- "If I assign this ticket to the wrong team, we will breach our SLA target."
- "How can I focus on complex technical troubleshooting when triage takes all my time?"

DOES

- Reads short descriptions and body text of every new ticket manually.
- Re-assigns tickets returned by Tier-2/3 engineers back into the queue.
- Applies manual filters to spot high-priority outages trapped in unassigned pools.

FEELS

- **Frustrated:** Dealing with mundane, highly repetitive administrative sorting.
- **Overwhelmed:** Stress caused by growing ticket queues during peak hours.
- **Anxious:** Constant pressure of missing critical SLA targets due to misclassifications.

4. ENVIRONMENT & INFLUENCING FACTORS

WHAT DOES THE USER HEAR?

- **IT Managers:** "Keep the unassigned queue at zero and ensure no ticket breaches its SLA response window."
- **End Users / Customers:** "My issue was logged two hours ago—why has no one taken ownership yet?"
- **Domain Engineers (Tier-2/3):** "Why was this ticket assigned to database administration? It belongs to network security."

WHAT DOES THE USER SEE?

- A constantly accumulating queue of unassigned tickets in the Service Desk dashboard during operational hours.
- Tickets bouncing back and forth between functional groups due to incorrect initial tags ("Ticket Ping-Ponging").
- Vague or unstructured ticket entries logged by end-users (e.g., "System error" or "Internet down").

5. PAINS & GAINS ANALYSIS

PAINS (CURRENT BOTTLENECKS)

- **Manual Friction:** Spending 2 to 5 minutes per ticket solely reading and categorizing.
- **High Re-assignment Rate:** Misclassification causes tickets to circulate between teams.
- **Delayed First Response:** Critical issues sit idle in unassigned pools awaiting human triage.
- **Agent Burnout:** Cognitive fatigue from repetitive administrative tasks.

GAINS (EXPECTED OUTCOMES)

- **Instant Classification:** Automated tagging of Category and Assignment Group via Flow Designer.
- **Zero Manual Triage:** Unburdens Tier-1 agents, allowing focus on actual resolution.
- **Improved SLA Compliance:** Instant routing eliminates queue delay and prevents SLA breaches.
- **Consistency:** Rule-based pattern logic ensures predictable and accurate classification.

Key Insight from Empathy Analysis:

The primary friction point is not technical resolution capability, but the administrative overhead of initial classification. Automating this step directly solves agent burnout and lowers mean time to resolution (MTTR).

6. SOLUTION ARCHITECTURE & FLOW DESIGNER FEATURES

Based on the empathy map insights, the proposed solution embeds automated logic directly into the ticket ingestion pipeline using enterprise Flow Designer:

1. TRIGGER CONDITION

Fires automatically upon the creation of a new Incident or Request item in the system.

2. TEXT PARSING & PATTERN MATCHING

Scans short description and detailed body text for key indicators (e.g., "VPN", "Password Reset", "Hardware Failure").

3. DYNAMIC MAPPING LOGIC

Matches identified terms against configurable rules to set Category, Subcategory, and Priority.

4. AUTOMATED ASSIGNMENT & ROUTING

Routes tickets directly to specialized resolver queues (e.g., Network, Security, Identity Management).

7. USER EXPERIENCE TRANSFORMATION (BEFORE VS. AFTER)

METRIC / DIMENSION	BEFORE FLOW DESIGNER (MANUAL STATE)	AFTER FLOW DESIGNER (AUTOMATED STATE)
Triage Speed	3 – 5 minutes per ticket	< 1 second (Instantaneous)
Routing Accuracy	~75% (Prone to human error)	> 95% (Standardized rule-driven)
User Satisfaction (CSAT)	Lower due to queue wait times	Higher due to immediate assignment
Agent Time Allocation	40% spent sorting & categorizing	100% focused on technical resolution

8. CONCLUSION

The **Auto Ticket Classification using Flow Designer** project directly addresses the core operational pains identified in this empathy map. By replacing manual triage with automated, rule-based workflows, the solution creates a streamlined ITSM experience for both support engineers and end-users.
